A PROJECT REPORT
(Project I CAPJ256)

On

" HOMEWORK DIARY MANAGEMENT SYSTEM "

Submitted To:

Department of Bachelor in Computer Application

Mahendra Multiple Campus Nepalgunj,

Banke

In partial fulfillment of the requirements for the Bachelors in Computer Application

Submitted By:

Bishal Basyal

TU Registration No: 6-2-55-15-2023

Symbol No: 5502152

Feb 2026

Under the Supervision of

Mr. Lokendra BK

Tribhuvan University

Faculty of Humanities and Social Sciences

Mahendra Multiple Campus, Nepalgunj

Supervisor's Recommendation

I hereby recommend that this Project I (CAPJ256) prepared under my supervision by **Bishal Basyal (Batch 2023, TU Registration No. 6-2-55-15-2023, Symbol No. 5502152)** entitled **"HOMEWORK DIARY MANAGEMENT SYSTEM"** in partial fulfillment of the requirements for the degree of Bachelor in Computer Application is recommended for the final evaluation.

……

SUPERVISOR

Lokendra BK

Bachelor in Computer Application (BCA)

Mahendra Multiple Campus

Nepalgunj, Banke

Tribhuvan University

Faculty of Humanities and Social Sciences

Mahendra Multiple Campus, Nepalgunj

Letter of Approval

This is to certify that this Project I (CAPJ256) prepared by **Bishal Basyal (Batch 2023, TU Registration No. 6-2-55-15-2023, Symbol No. 5502152)**, entitled **"HOMEWORK DIARY MANAGEMENT SYSTEM"** in partial fulfillment of the requirements for the degree of Bachelor in Computer Application has been evaluated. In our opinion, it is satisfactory in the scope and quality as a project for the required degree.

Abstract

The Homework Diary Management System is a website solution designed to simplify and organize the process of assigning, tracking, and managing homework in educational institutions. This document provides an overview of the system, its objectives, features, and overall benefits.

The primary objective of the Homework Diary Management System is to establish an efficient digital platform that enables seamless interaction between students, teachers, and school administration. The system offers various functionalities, including user-friendly dashboards for students to view and submit homework, and a teacher/admin panel to assign tasks, monitor progress, and manage academic activities effectively.

The results of the design and implementation of the Homework Diary Management System demonstrate its capability to improve academic workflow, enhance communication, reduce paperwork, and support timely homework submission. By providing a structured and accessible platform, the system contributes to better time management and improved academic performance.

Acknowledgement

This project would not have been possible without the help, guidance, and support of many individuals, despite the sincere efforts made by our side. We would like to take this opportunity to express our heartfelt gratitude to everyone who contributed directly or indirectly to the successful completion of this project.

I am deeply grateful to **Mahendra Multiple Campus** and all its respected faculty members for providing us with a supportive academic environment and the necessary resources required for this project. Their encouragement and supervision played a vital role in helping us complete our work effectively.

I would like to express our sincere thanks to our project guide, **Mr. Lokendra BK**, for his valuable guidance, constant support, and constructive suggestions throughout the development of this project. His cooperation and timely feedback helped us to improve our understanding and successfully complete the project.

Finally, I would like to thank our family members and friends for their continuous encouragement and moral support, which motivated us to complete this project successfully.

Bishal Basyal

Chapter 1: Introduction

1.1 Introduction

The Homework Diary Management System is a web-based application designed to simplify the process of assigning and managing homework or assignments in schools and colleges. Traditionally, teachers announce homework in class or write it on the board, which often leads to students missing or forgetting tasks. This system provides a digital platform where teachers can upload homework details, attach reference files, and specify due dates, while students can log in anytime to view and download the assigned homework. It ensures efficient communication between teachers and students, enhances productivity, and promotes digital learning.

With the rapid advancement of information technology, educational institutions are increasingly adopting digital solutions to improve academic efficiency. Homework plays a crucial role in reinforcing classroom learning, but managing homework manually is often inefficient and unreliable. The Homework Diary Management System is designed to address these challenges by providing a digital platform that simplifies homework assignment and tracking.

This system allows teachers and students to interact through a centralized application, ensuring accurate communication and easy access to academic tasks. The project focuses on usability, reliability, and simplicity, making it suitable for implementation in schools and colleges.

1.2 Problem Statement

In the current system, homework management is manual - teachers provide assignments verbally or in written form, and students must record them individually. This leads to several issues:

- Students may miss or forget homework details.
- There is no centralized record of homework history.
- Communication gaps between teachers and students cause confusion and delays.

Thus, a digital solution is needed to automate and organize homework distribution and access.

1.3. Objectives

Our website focuses on providing quality services to the both teacher and student digitally. Some of the main objectives are listed below:

1. To digitize homework assignment and distribution processes.
2. To allow teachers to upload homework with subjects, descriptions, and due dates.
3. To enable students to view and download homework anytime.
4. To reduce paperwork and improve communication efficiency.

1.4 Scope and Limitation

Every website owns unique features and its limitations. The RBMS website offers scope and limitation:

1.4.1 Scope

1.Homework Management:
The system allows teachers to assign homework digitally and enables students to view homework details along with submission deadlines in an organized manner.

2.Academic Coordination:
The system improves communication between teachers and students by providing a centralized platform for homework-related information.

1.4.2 Limitation

1. Limited Features:
The system focuses only on homework management and does not include advanced features such as online grading, attendance tracking, or automated notifications.

2. Internet Dependency:
The system requires a stable internet connection to access homework information, which may limit usability in areas with poor connectivity.

1.5 Report Organization

This report document contains of five chapter including this chapter. Chapter two defines background study and overview of related existing system and their advantages and disadvantages. Chapter three present the System Analysis and Design including Requirement Analysis and Feasibility Analysis. Chapter four explains the Implementation, Testing and Debugging. In chapter five, Conclusion, Limitation and Future Enhancement are briefly explained.

Chapter 2: Background study and Literature Review

2.1 Background Study

Educational institutions play an important role in providing academic learning to students. Homework is a key part of the learning process as it helps students revise classroom lessons and improve their understanding. Traditionally, homework is assigned verbally by teachers or written on the board and recorded by students in their physical diaries. However, this manual method often leads to problems such as forgotten assignments, misplaced records, or misunderstanding of homework instructions [1].

In Nepal, many schools and colleges still rely on manual systems for homework management. Due to this approach, teachers may face difficulties in tracking homework submissions and monitoring student progress effectively. Students may also miss deadlines because they forget or misplace their homework records [2].

Since homework information is maintained manually, retrieving accurate and timely data becomes difficult. This situation highlights the need for a digital solution that can manage homework efficiently. A Homework Diary Management System can provide a centralized platform where teachers can assign homework, students can view tasks, and records can be maintained digitally for better coordination and monitoring.

2.2 Literature Review

The use of information technology in the education sector has increased significantly over the past decade. Various digital systems such as learning management systems, student information systems, and online assessment platforms have been developed to improve teaching and administrative efficiency [3].

Many existing school management systems provide features such as attendance tracking, result publication, student information management, and online learning materials. However, homework management is often treated as a minor feature rather than a dedicated module. As a result, it may not fully support effective assignment tracking and communication between teachers and students [4].

Research shows that digital homework management tools help students organize their tasks better and assist teachers in monitoring academic activities more effectively. These systems

improve communication, reduce the chances of lost assignments, and make academic management more efficient [5].

Therefore, the **Homework Diary Management System** is designed to address these limitations by providing a structured platform for homework assignment, tracking, and record management.

Chapter 3: System Analysis and Design

3.1 System Analysis

System analysis is a crucial phase in the development of the Homework Diary Management System, as it helps identify system requirements, feasibility, data flow, and overall functionality. This phase involves requirement analysis, understanding user needs, and evaluating system constraints to ensure efficient performance.

It requires that software development follows the following stages:

- Requirements are to be proposed.
- System design should be made according to the requirements.
- Implementation of the features according to the design.
- Integration and testing of the system.
- Deployment of the system.
- Maintenance of the system.

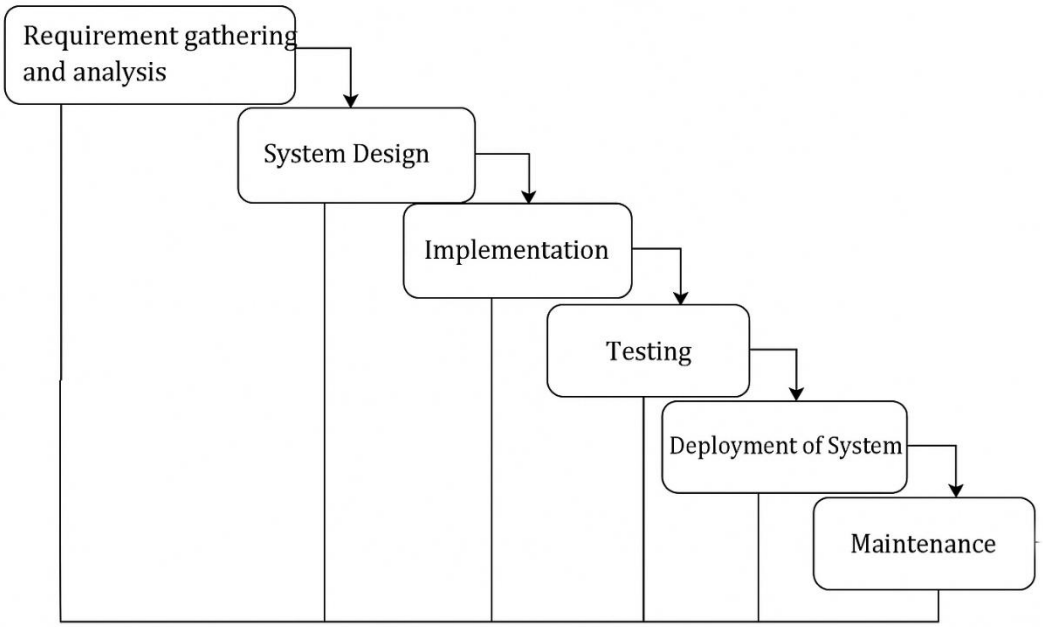

Fig: Waterfall Methodology

3.1.1 Requirement Analysis

Requirement analysis is the process of identifying and documenting the functional and non-functional requirements of the system. This step ensures that the developed system meets the expectations of students, teachers, and administrators.

i. Functional Requirements

Functional requirements describe the specific operations and features that the system must perform. The functional requirements of the Homework Diary Management System are listed below:

1. **User Registration and Authentication:**

- The system shall allow students, teachers, and administrators to register and log in securely.
- Authentication mechanisms shall be implemented to ensure authorized access.

2. **Homework Assignment Management:**

- Teachers shall be able to assign homework with subject details, descriptions, and due dates.
- Students shall be able to view assigned homework anytime.
- Teachers shall be able to assign homework with subject details, descriptions, and due dates.
- Students shall be able to view assigned homework anytime.

3**. Admin Management:**

- Administrators shall manage user accounts, subjects, and system data.
- Admins shall generate reports related to homework activities.

4.**Notification System:**

- Students shall receive notifications regarding new homework and deadlines.
- Teachers shall be notified about homework submissions.

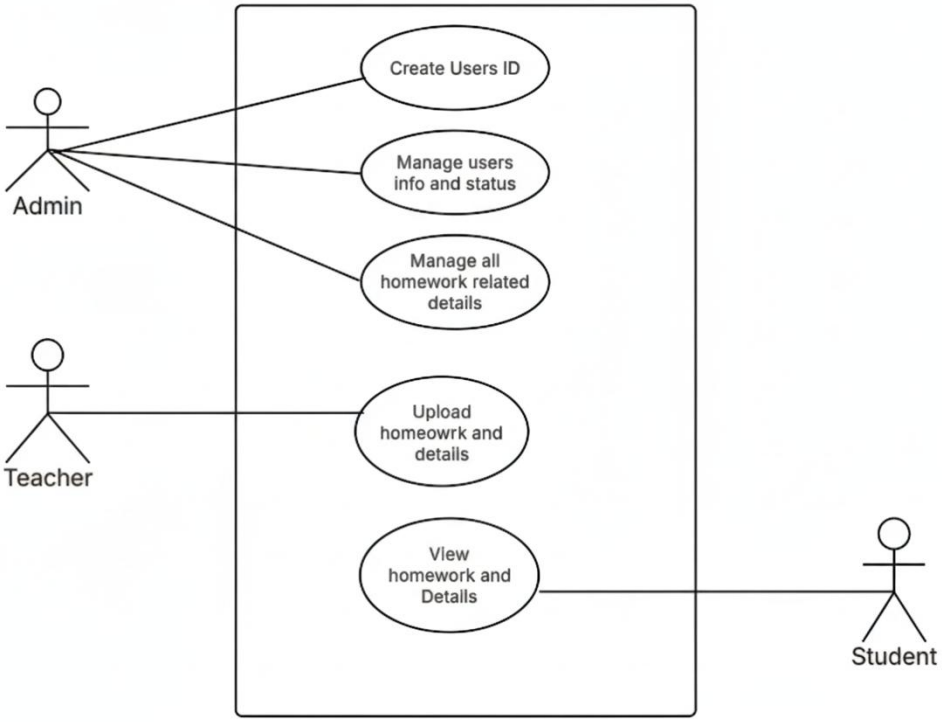

Fig 1: Use Case Diagram

Non-Functional Requirements

The following are the non-functional requirements of Homework Diary Management System:

1. **Performance:**
   The system shall respond quickly to user actions such as login, homework viewing, and assignment updates.
2. **Usability:**
   The system shall be simple and user-friendly so that students, teachers, and administrators can use it easily.
3. **Security:**
   The system shall ensure secure login and protect user data from unauthorized access.
4. **Reliability:**
   The system shall work consistently and store homework data accurately without frequent errors.

5. **Maintainability:**
   The system shall be easy to maintain and support future enhancements

3.1.2 Feasibility Study:

The feasibility study for the Homework Diary Management System (HDMS) was conducted to assess the practicality and viability of developing the platform. This analysis evaluates technical, operational, economic, and schedule feasibility to ensure the project can be successfully implemented within school environments and available resources.

i. Technical Feasibility

The technical feasibility of the HDMS is highly favorable. The system is built using a standard web stack: **HTML5, CSS3, and JavaScript** for the frontend, with **PHP** and **MySQL** managing the backend and database.

- **Integration:** The use of **AJAX** allows for real-time updates of homework assignments and submission statuses without page reloads.
- **Accessibility:** By utilizing the **Font Awesome CDN** and responsive CSS frameworks, the system ensures that students can access their diaries on various devices, including smartphones, tablets, and laptops.
- **Resources:** Development requires standard tools like **VS Code** and **XAMPP/WAMP** for local hosting. Since the system handles text-based data and small file uploads (assignments), it does not require high-end server infrastructure.

ii. Operational Feasibility

The HDMS addresses the common problem of lost physical diaries and miscommunication between school and home.

- **User Roles:** The system is designed with distinct interfaces for **Teachers** (to post homework), **Students** (to track tasks), and **Parents** (to monitor progress).
- **Ease of Use:** The intuitive UI ensures that even younger students or less tech-savvy parents can navigate the platform with minimal training.

- **Efficiency:** Automating the tracking of deadlines and providing a centralized repository for study materials significantly improves the academic workflow and organizational habits of students.

iii. Economic Feasibility

The HDMS project is exceptionally cost-effective.

- **Open Source:** The entire development stack (PHP, MySQL, Apache) is open-source, eliminating licensing fees.
- **Hardware:** The system is lightweight and can run on existing school computers or basic web hosting services.
- **Long-term Savings:** By transitioning to a digital diary, schools can reduce recurring costs associated with printing physical planners and paper-based notifications.

iv. Schedule Feasibility

The timeline for the HDMS is realistic and structured.

- **Phased Approach:** The project follows an **Agile methodology**, allowing for iterative modules—starting with basic task entry and moving toward advanced features like parent notifications and file attachments.
- **Milestones:** Clear deadlines have been set for database schema design, frontend development, and rigorous beta testing.
- **Deployment:** The rollout is planned for the beginning of a new academic term or a mid-term break to ensure that students and staff have adequate time to transition from paper to digital without disrupting the current curriculum.

Tasks	Start Date	End Date	Duration(days)
Requirement Analysis	Nov 10	Nov 17	7
Design	Nov 18	Dec 9	20
Implementation	Dec 9	Jan 1	25
Integration and Testing	Jan 2	Jan 12	10
Deployment	Jan 13	Jan 18	5
Maintenance	Jan 19	Jan 25	5

Table 1: Time Schedule Table

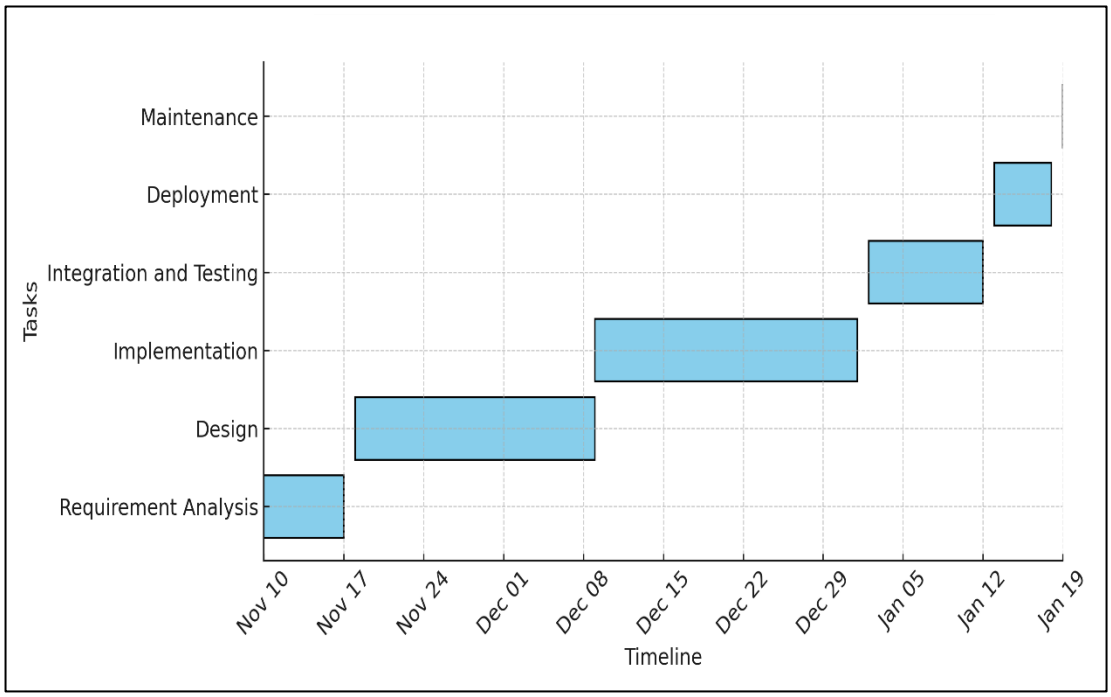

Fig 2: Gantt Chart

3.1.3 Data Modelling

Data modeling for the Homework Diary Management System (HDMS) involved designing a well-structured and organized schema to manage academic information, including users (students, teachers, and parents), assignments, subjects, submissions, and notifications. The

database schema was implemented using SQL, with multiple related tables to ensure data integrity, normalization, and efficient retrieval of school-related data.

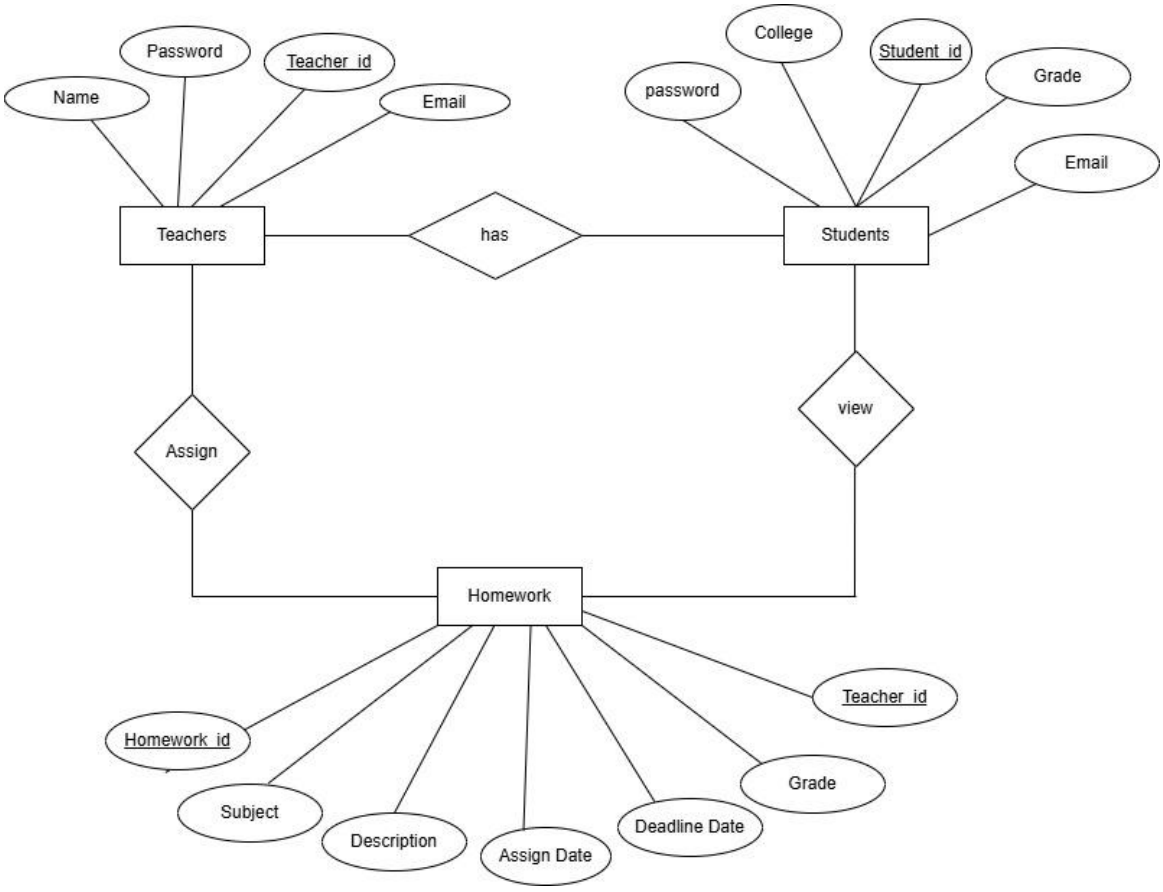

Figure 3: ER Diagram

3.1.4. Process Modeling

Process modeling for the Homework Diary Management System (HDMS) was carried out to understand the flow of data and interactions within the system. The main tool used was the Data Flow Diagram (DFD), which shows how data moves through the system, the processes that handle the data, and the external entities involved.

The DFD represents key operations such as homework assignment by teachers, storage of homework details, and viewing of homework by students. It helps ensure that homework information like subject, deadline, and description is correctly transferred from teachers to students. This modeling approach ensures clarity, efficiency, and completeness of the system's processes.

3.4.1 Level 0 DFD or Context Diagram

The context diagram provides a high-level view of the HDMS system, showing its interactions with external entities such as sellers, buyers, and administrators.

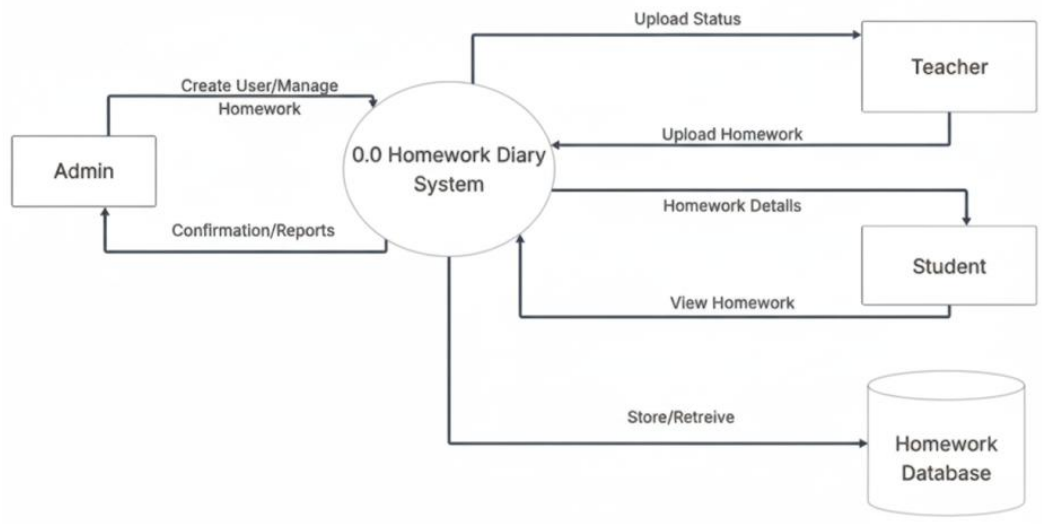

Figure 4: Level 0 DFD

3.4.2 Level 1 DFD:

The level 1 DFD for Scrap-Z shows the main processes and data stores involved in the system.

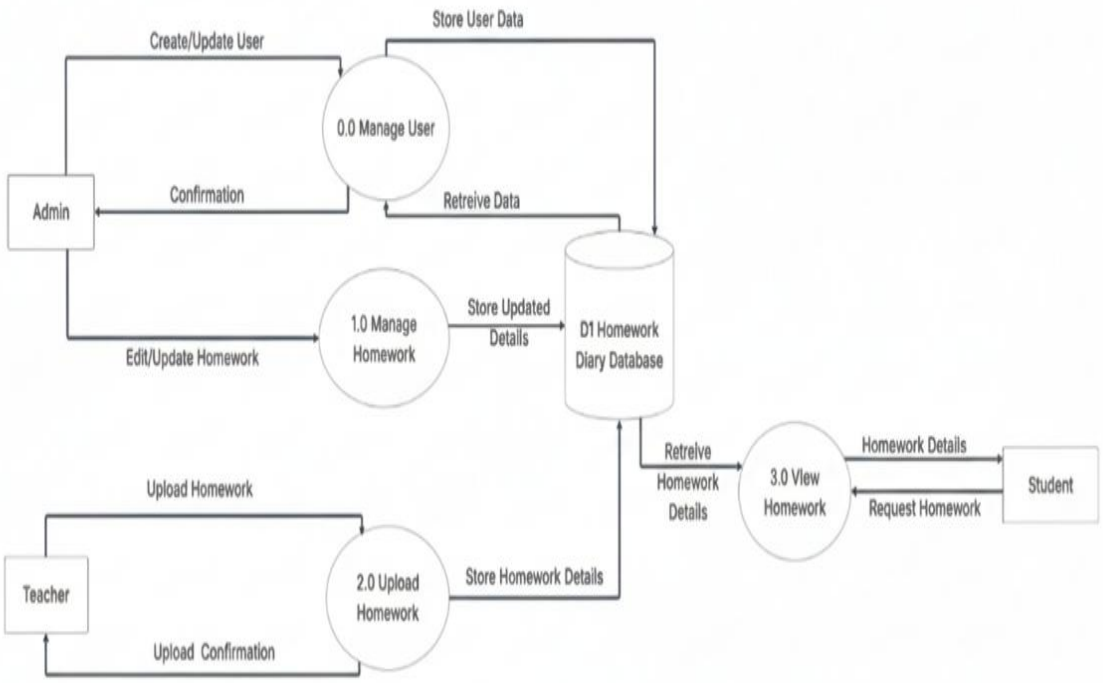

Figure 5: Level 1 DFD

3.2 System Design

An RBMS (Relational Database Management System) project in system design focuses on designing a system to manage and organize data efficiently using a relational database. In simple terms, the goal is to create a structured way of storing data in tables, where each table holds related information (like a homework record and details). These tables can be linked together using relationships to make it easy to access and manipulate data. The project involves defining how data will be stored, accessed, and modified through operations like adding, deleting, and updating. The system is designed to ensure data consistency, security, and scalability.

3.2.1 Database Architectural Design

The architectural design of the Scrap-Z platform follows a three-tier architecture comprising the Presentation Tier, Logic Tier, and Data Tier. • Presentation Tier: This tier is responsible for interacting with the user through the web interface. It is developed using HTML5, CSS3, JavaScript, Leaflet-Map CDN, Font-Awesome CDN, and Google Fonts. • Logic Tier: This tier contains the core application logic and processes requests from the Presentation Tier. It is implemented using PHP and PHP Composer. • Data Tier: This tier manages the database and handles data storage and retrieval. It uses MySQL as the database management system. The architecture ensures separation of concerns, enabling easier maintenance, scalability, and enhanced security.

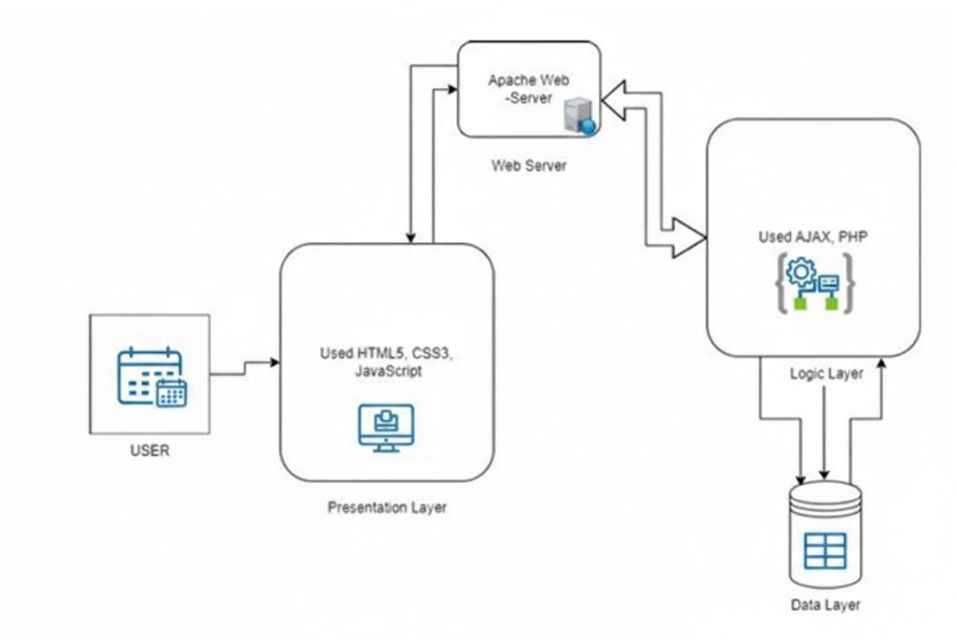

Figure 6: Database Architecture Design

3.2.2. Database Schema Design

The database schema design for the HDMS platform involves defining the structure of the database, including the tables, fields, and relationships between them. The schema ensures that all necessary data is stored efficiently and can be retrieved and manipulated as needed. The database schema of HDMS is given below:

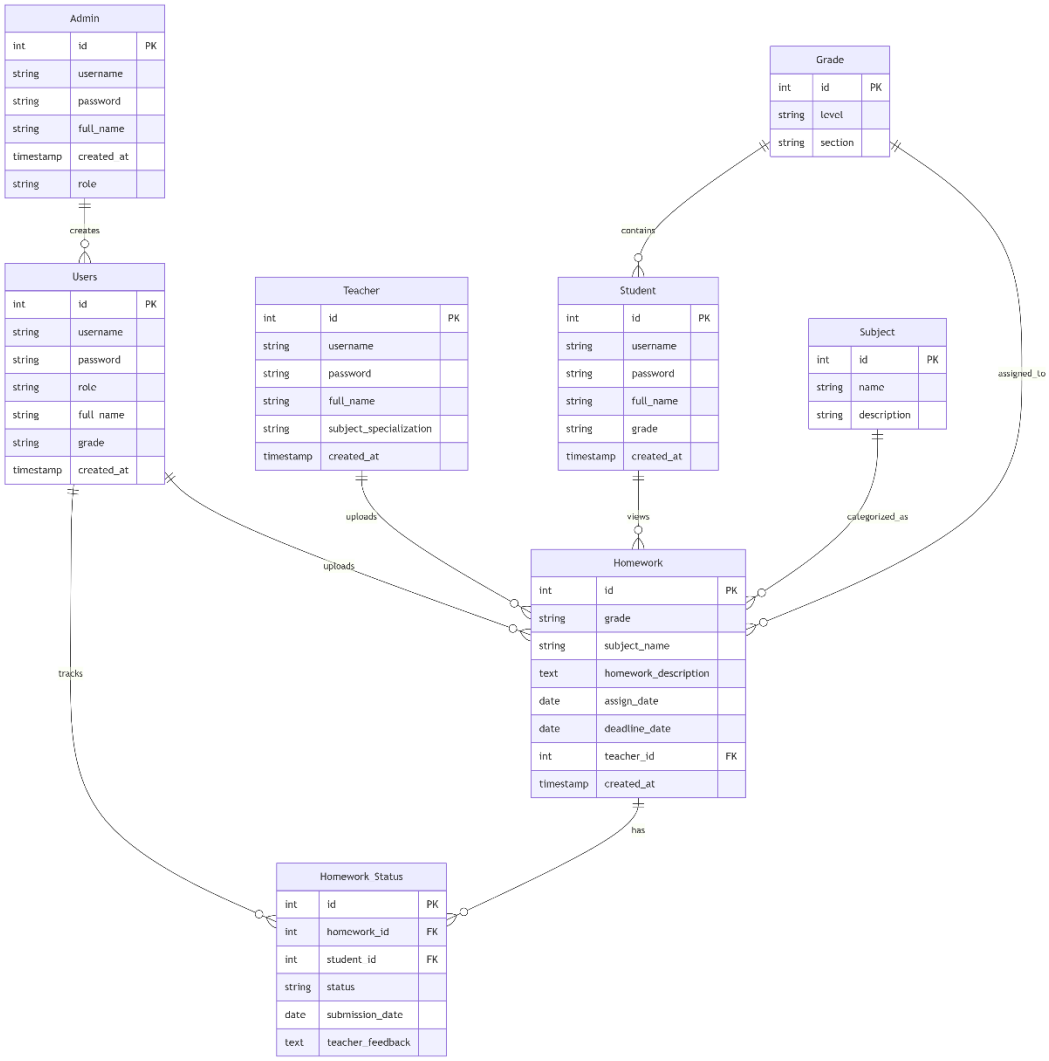

Figure 7: Database Schema Design

Chapter 4: Implementation and Testing

4.1 Implementation

In this stage, physical system specification is converted into working and reliable solution. This is stage where the system is developed. On the receiving the system design documents, the working is divided in modules / units and actual coding is started. It is flowed by testing.

Several tools are in this phase if software development.

4.1.1 Tool Used

The Homework Diary Management System project, several tools were used to make the system work smoothly. The main tool was a database like MySQL or SQLite to store customer orders, billing information, and menu details. Programming languages such as JavaScript were used to create the system's logic and user interface. Additionally, HTML and CSS helped design the website's appearance, making it easy for users to interact with. For managing the system and keeping track of changes, tools like Git were also used.

1. CASE Tools

Tools	Purpose
Sigma	For UI/UX design and prototyping.
Draw.io, Visual Paradigm	For system design and modeling.

Table 2: CASE Tools

2.Development Tools

Tools	Purpose
phpMyAdmin	For database management and SQL query execution.
GitHub	For version control and collaboration.
Visual Studio Code (VS-Code), Sublime Text	For coding, compile and debugging the application.
Chrome Browser, Microsoft Edge	For testing and debugging the web application.
XAMPP	For creating a local web server to test the application in a development environment.

Table 3: Development Tools

3.Programming Languages

Language	Purpose
HTML5	For Framing of the application and structuring web content.
CSS3	For styling or designing web pages.
JavaScript	For add dynamic content and interactivity or Client-side Functionality of the application.
PHP	For server-side scripting and backend logic.
AJAX	For asynchronous web requests, data transfer and server interaction through

Table 4: Programming Language

4.Database Platforms

Database tools and language	Purpose
MySQL, Maria DB	For storing and managing data related to users, listings, and transactions.
`Local Storage	For saving draft scrap requests on the client-side for persistence across sessions.
Indexed-DB	For storing larger and more complex draft requests on the client-side, providing a more robust storage solution than Local Storage.
Session, Cookies	For maintaining user sessions and storing temporary data such as user preferences and login status.

Table 5: Database Platforms

5. Other Tools

Tools	**Purpose**
Google Fonts CDN	For enhancing the visual appeal with custom fonts.
Font-Awesome Icons CDN	For adding scalable vector icons and social logos to the user interface.

Table 6: Other Tools

4.2 Testing

The Homework Diary Management System involves creating a comprehensive and reliable testing framework to evaluate all system functionalities. The testing process is designed to ensure seamless interaction between teachers, students, and administrators while maintaining data integrity and system security.

ID	Test Case Description	Tested Data	Expected Result	Actual Result	Test Result
TC-HDM-1	User Creation (Admin)	New Teacher/Student credentials & role	Admin dashboard should confirm user creation.	User successfully added to database.	Pass
TC-HDM-2	Homework Upload	Valid Grade, Subject, and Deadlines	Data should be saved and visible to assigned grade.	Homework details saved successfully.	Pass
TC-HDM-3	Homework View	Student login with valid ID	Student should see a list of assignments for their grade.	Dashboard displayed all current assignments.	Pass
TC-HDM-4	Invalid Data Upload	Empty subject or past deadline date	System should show error message for invalid input.	System prompted user to fill required fields.	Pass

Table 7: Testing Table

Chapter 5: Conclusion and Future Recommendations

5.1. Outcomes

The Homework Diary Management System (HDMS) successfully created a comprehensive and user-friendly digital platform that streamlined the process of assigning, tracking, and viewing school homework. The platform facilitated a more efficient interaction between teachers and students, allowing teachers to digitally upload assignments with specific details such as grade, subject name, homework description, assignment date, and deadlines.

On the administrative side, the system provided robust user management, enabling the admin to securely create unique IDs and roles for both teachers and students, ensuring that each user has access to the appropriate tools. Students benefited from a centralized dashboard where they could view their academic responsibilities in real-time, reducing the likelihood of missed deadlines.

The system's efficiency in automating the diary process significantly improved the overall educational experience, resulting in better organization for students and a simplified workflow for educators. Overall, the development and implementation of HDMS demonstrated the potential of digital solutions in improving the communication and accountability within the classroom environment

5.2 Conclusion

In conclusion, the development of the Homework Diary Management System (HDMS) demonstrates significant progress in digitizing traditional classroom management. The system is designed to improve the academic experience by enabling teachers to post assignments directly to a web-based platform, which students can then access from any device.

During this phase, considerable advancements have been made in defining the system's functional requirements, such as the admin's ability to manage user IDs and the Teacher's ability to upload homework with specific parameters like grade, subject Name, and Deadline Date. Key design elements, including the 3-Tier Architecture and the Database Schema, have been developed to ensure a robust data structure and a seamless flow of information between the presentation and data layers.

The HDMS is on track to create a seamless, user-friendly platform that streamlines the communication of academic tasks. This system is expected to improve institutional efficiency, reduce the risk of students forgetting assignments, and enhance accountability by providing a clear digital record of all homework assigned. As the project progresses, the final version of the system will serve as a valuable tool for schools, providing better organization for students and a modernized workflow for educators.

5.2 Future Recommendations

The **HDMS** platform can be further improved by adding the following features:

- **Mobile Application:** Developing a dedicated mobile app for Android and iOS to provide push notifications for upcoming deadlines and instant alerts when new homework is posted.
- **File Submission Portal:** Allowing students to upload their completed assignments directly through the system in PDF or image formats for teacher review.
- **Automatic Reminders:** Integrating an email or SMS alert system that automatically notifies students 24 hours before a Deadline Date.
- **Parental Access:** Creating a third user role for parents, allowing them to view their child's homework diary and track completion status.
- **Analytics Dashboard:** Implementing a teacher dashboard to track submission rates and identify subjects where students may be struggling with the workload.
